IVEN CLOUD PLATFORM

CASE STUDY

Overview

In 1995, Teknoklima started its services with distributorship activities in the air conditioning sector and manufactured Boreas HVAC devices in 2014.

Teknoklima was unable to collect and store data instantly and unable to follow its devices from different screens remotely. Also, incorrect failure notification to its after-sales services was affecting the efficiency of operations.

Teknoklima recognized the advantages of adopting IoT and chose to work with Iven to make Boreas branded air conditioners compatible with IoT in order to increase effectiveness of sales and after-sales activities with strong capital structure and dynamic organization without compromising the quality of services.

"IVEN enabled us to create a high performance, secure, cost-effective and highly detailed system. "

The Need

Teknoklima could not determine the source of device failures and had no remote device access, thus unable to follow devices from different screens. Teknoklima had been needed instant storage of data from devices for enhancing its after-sale services and looking for a solution which would provide reliable failure notifications.

Teknoklima decided to choose an expert business partner in the Internet of Things area while creating Boreas IoT. With its wide knowledge, scalability and reliability Iven accompanied Teknoklima in its digital transformation journey.

"The flexibility of the IVEN's cloud platform, allowed that we can shape the Boreas IOT system according to our needs. "

Challenges

- Incorrect device failure notifications
- Lack of device tracking by different users
- Instant storage problems of data

Goals

- Real-time data flow
- Reduction in filed visit costs
- Device tracking by multiple users

Solution

To make the air conditioners compatible with IoT, GSM modules were added to the devices. Hardware Partner Ecosystem of Iven contributed to the project and with collaboration, IVEN created the all infrastructure of the cloud system while allowing the devices to be connected through the IoT communication modules.

Business Benefits

Remote Controlling: Remotely accessed device data enabled to establish a clear communication within organization.

Historical Data: The storage of historical data allowed Teknoklima to make effective decisions.

Monitoring and Reporting: Mechanical failures can be identified and tracked. According to this, field teams are informed about the defective part of the air conditioners in advanced. Device related usage data can be tracked and exclusive reports can be generated daily, weekly or monthly.

Alarm Creation: Warnings can be received and necessary alarms can be created

Location Mapping: Easy and rapid reach to customers' location

Cross Display: Enabled the access of customer service employees to Iven Screens and viewing the problem that occurred remotely.

Why Iven?

Iven created a customised platform for our needs. It is a detailed, secure and cost-effective system.

Results

- Identification of the cause of failure of the devices and obtaining maximum efficiency from field visits
- Increase in after-sales service quality and customer satisfaction
- Increase in R&D efficiency

Results

Teknoklima shaped the Boreas IoT system according to its needs and created its own customised IoT platform. R&D efficiency and after-sales service quality have increased as a result of real-time data from the field. Detecting the cause of the failure of the air conditioner correctly and instantaneously allowed Teknoklima to reduce field visit costs and improve customer satisfaction.
