IVEN CLOUD PLATFORM

CASE STUDY

Overview

Vestel, one of the world's largest technology companies, consist of 23 companies, 16 of which are abroad. Vestel has a wide range of products including consumer electronics, home appliances, digital products, information technology and LED lighting.

Vestel was looking for a solution to reduce customer complaints related to the functions of the Puzzle Refrigerator while reducing the field visit costs.

Hoping to establish a quality customer service and reduction in after-sales costs, Vestel turned into IoT solutions. Vestel chose to work with Iven, as Iven is a leading company in the Turkish IoT Market and provided customized Iven Cloud Platform for Vestel.

"Thanks to Iven, we are able to deliver a better customer experience."

The Need

Vestel had been facing with the misuse of the refrigerator and the problems arising from it. 60% of customer complaints were due to general functions and touch screen of the refrigerator. To be able to effectively communicate with the customer and help them to solve the issue, clarity in communication is critical for Vestel Customer Service and Call Center.

To maintain a quality customer service, Vestel was looking for a solution which would shorten the waiting time of the customer and allow Vestel to intervene with the problem immediately while reducing the field visiting costs and duration.

"We were looking for a solution which would shorten the waiting time of the customer and allow us to intervene with the problem immediately"

Challenges

- 60% of customer complaints were due to misuse of the Puzzle Refregerator
- High field visit costs

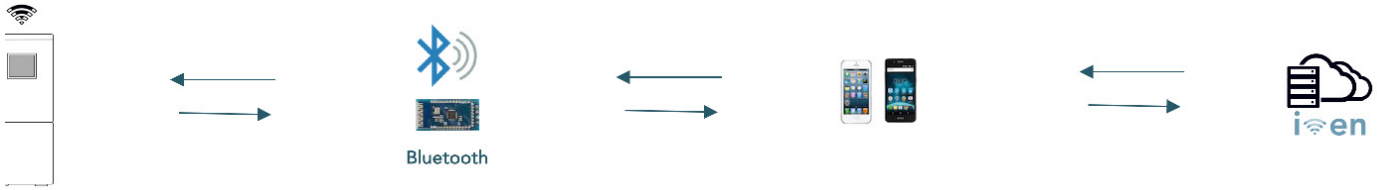

Goals

- To create an A+ product which aims to maximize the user satisfaction and minimize the error rate.

Solution

Iven Cloud Platform installation enabled the data stream from the Puzzle Refrigerator to the Mobile Intelligent Diagnostic Application and connect the call center screen to application through Bluetooth. With Iven Product Cloud call center employees have become able to cross display the Puzzle Refrigerator screen on their call center screen. Call center staff can remotely access to the screen of the refrigerator and analyze the data.

In the failures requiring Vestel Authorized Service intervention, defective part of the refrigerator is detected and the necessary spare part code is transmitted to the Vestel Authorized Service. By this way, the resolution time of the failures is reduced to the minimum. Vestel took full advantage of Iven Cloud Platform and made it applicable to call center screens in order to improve after-sales service efficiency.

Business Benefits

Remote Controlling: Remotely accessed device data enabled call center employees to establish a clear communication with the customer.

Historical Data: The storage of historical data allowed Vestel to make effective decisions regarding

Location Mapping: Easy and rapid reach to customers' location

Cross Display: Enabled the access of customer service employees to Iven Screens and viewing the problem that occurred remotely.

Monitoring and Reporting: Mechanical failures can be identified and tracked. According to this, field teams are informed about the defective part of the refrigerator in advanced. Device related usage data can be tracked and exclusive reports can be generated daily, weekly or monthly.

Why Iven?

Iven solutions are highly flexible, customized and

Results

- 50% reduction in after-sales costs
- Increased customer satisfaction
- Decreased in field visit costs due to efficient defect detection

Results

In the "Contact Center World Awards" contest where the best projects in the call center sector were selected, Vestel won the first place with the Puzzle Refrigerator in the "Best Use of Self-Service Technology" category.

Solution, related to the problem that occurred in Puzzle Refrigerator, is provided in the first intervention and time loss is minimized as field teams have been informed in advance. The field teams contributed to the continuity of the ecosystem with less field visits, which resulted in the reduction of vehicle exhaust consumption. Vestel learned the sources of the failures and used this knowledge for product improvements. Intelligent Diagnostic Application increased the quality of after-sales service and recorded a significant increase in customer satisfaction. Also, after-sales service costs decreased by 50%.

Integrating IoT to the Puzzle Refrigerator makes it much easier to perform improved communication across business units.
